**PLEASE READ THE DIRECTIONS CAREFULLY:**

This exam has three parts:

**Part A:** Group Theory, **Part B:** Field and Galois Theory, **Part C:** Ring and Module Theory.

**\*\* SOLVE A TOTAL OF SIX QUESTIONS: TWO FROM EACH PART A, B AND C \*\***

- Mark in the table above (put a check mark in the square below the problem number) which of the problems are to be graded; ***otherwise, regardless of the problems you have worked on, problems 1, 2, 4, 5, 7, and 8 will be graded.***
- Start each solution on a **new sheet of paper**, write the problem number and page number (of the particular problem). The pages should be numbered **separately for each problem** with the first page of each problem having number 1.
- Write the solution on **one side** of the paper and stay within the borders. Anything written outside the borders will not be taken into account.
- For each solution submitted, write in the table above how many pages you submit. **Do not submit scratchworks and solutions that are not to be graded.** Return your solutions with pages in correct order arranged according to problem numbers and together with this cover page.
- Please write big and legibly. Proofs cannot be graded unless they can be read. Justify your arguments with complete sentences using correct English grammar. *Answers, even correct, without justifications will not receive full credit.*
- **If you make use of a result which you do not prove, write separately the complete statement of the result you use underneath your proof, and refer to it within your proof.**
- You should not interpret any question as trivial by referring to a result from a textbook.

## Part A. Group Theory

**Conventions.** For a given group  $G$ ,

- $|G|$  and  $|x|$  denote the *order* of  $G$ , and the order of an element  $x \in G$ , respectively.
- $[G : H]$  denotes the *index* of a subgroup  $H$  of  $G$  in  $G$ .
- $Z(G)$  denotes the *center* of  $G$ .

### Questions.

- (1) Let  $G$  be a *finite* group,  $H$  a *normal* subgroup of  $G$ , and let  $p$  be a prime integer. Assume  $|H| = p^i$  for some  $i \geq 1$ . Prove that  $H$  is contained in every Sylow  $p$ -subgroup of  $G$ .  $\square$

- (2) Let  $G$  be a *finite* group such that  $G$  is *not* abelian, and  $|G| = p^3$  for some prime integer  $p$ . Assume  $H$  is a subgroup of  $G$  such that  $|H| = p^2$ . Prove that  $Z(G) \subseteq H$ , and  $H$  is normal in  $G$ .

(Hint: start by showing that  $Z(G) = \langle a \rangle$  for some  $a \in G$ . Suppose  $a \notin H$  and seek a contradiction of the hypothesis that  $G$  is not abelian. After proving  $Z(G) \subseteq H$ , consider the subgroup  $H/Z(G)$  of  $G/Z(G)$ .)  $\square$

- (3) Let  $G$  be a *finite* group,  $N$  a *normal* subgroup of  $G$ , and let  $P$  be a *Sylow*  $p$ -subgroup of  $G$  for some prime integer  $p$ . Assume  $[G : N] = |P| \geq 1$ . Prove that:

$$N = \{x \in G : |x| \text{ is not divisible by } p\}.$$

(Hint: start by writing  $|G| = p^n \cdot m$  for some positive integer  $m$  with  $\gcd(p, m) = 1$ .)  $\square$

## Part B. Field and Galois Theory

### Conventions.

- $\mathbb{Q}$  denotes the set of rational numbers.
- A *Galois* extension is a field extension that is finite, normal, and separable.

### Questions.

(4) Let  $E/F$  be a *finite* field extension, where  $F$  is an infinite field.

Assume there are finitely many intermediate fields of  $E/F$ .

Prove that  $E/F$  is a simple extension, i.e.,  $E = F(c)$  for some  $c \in E$ .

(Hint: explain first why it is enough to prove: if  $a, b \in E$ , then  $F(a, b) = F(c)$  for some  $c \in E$ .)

□

(5) Let  $F$  be a field of *characteristic*  $p$  for some prime integer  $p$ .

Assume every element of  $F$  has a  $p$ th root in  $F$ , i.e., if  $a \in F$ , there exists  $b \in F$  such that  $b^p = a$ .

Assume  $E/F$  is an algebraic field extension. Prove that  $E/F$  is a *separable* extension.

(Hint: let  $\alpha \in E$ , assume  $\alpha$  is not separable over  $F$ , and seek a contradiction.)

□

(6) Let  $F = \mathbb{Q}$ ,  $p(x) = x^4 - 14x^2 + 9 \in F[x]$ , and let  $E$  be the *splitting field* of  $p(x)$  over  $F$ .

Let  $G = \text{Gal}(E/F)$  be the *Galois group* of the field extension  $E/F$ .

Determine  $E$  explicitly, and prove that  $G \cong \mathbb{Z}_2 \times \mathbb{Z}_2$ .

(Hint: you may use the fact that there are only 2 groups, up to isomorphism, of order four.)

□

## Part C. Ring and Module Theory

### Conventions.

•  $R$  denotes a ring (not necessarily commutative) which has *multiplicative identity*  $1$  such that  $1 \neq 0$ . Moreover, all  $R$ -modules are assumed to be nonzero left modules.

### Questions.

- (7) Let  $A = \{a \in R \mid a \neq 1\}$  and  $B = \{a \in R \mid a + b = ab \text{ for some } b \in R\}$ .  
Prove that  $R$  is a *divison ring* if and only if  $A = B$ . □
- (8) Assume  $R$  is commutative. Assume further that each ideal of  $R$  is a free  $R$ -module.  
Prove that  $R$  is a principal ideal domain. □
- (9) Assume  $0 \rightarrow L \xrightarrow{f} M \xrightarrow{g} N \rightarrow 0$  is a short exact sequence of  $R$ -modules, i.e.,  $L$ ,  $M$  and  $N$  are  $R$ -modules,  $f$  and  $g$  are  $R$ -module homomorphisms such that  $f$  is injective,  $g$  is surjective and  $\text{im}(f) = \ker(g)$ . Assume further that there is an  $R$ -module homomorphism  $h : N \rightarrow M$  such that  $gh = 1$ , i.e.,  $g(h(n)) = n$  for all  $n \in N$ . Prove that  $M \cong L \oplus N$ , as  $R$ -modules. □

Write **big** and **legibly**. Your proofs cannot be graded if they cannot be read. Justify your arguments.
